

# Library Book Request Management System

## Problem Statement

- College libraries currently rely on manual or semi-manual processes to handle student book requests
- There is no centralized digital system to log, track, or validate requests
- Requests are often lost, delayed, or miscommunicated between students and librarians
- Librarians have no easy way to monitor request volume or status at a glance

## Proposed Solution

A ServiceNow-based custom application that digitizes the entire book request workflow:

- Students submit book requests through a structured digital form
- Each request is automatically assigned a unique tracking number
- The system validates that the requested issue date is not in the past
- The librarian is automatically notified by email when a new request comes in
- Requests can be tracked through statuses: **\*\*Pending → Approved / Rejected\*\***
- A dashboard gives the librarian a real-time visual summary of all requests

## Target Users

- **\*\*Students\*\*** — submit and track their own book requests
- **\*\*Librarian / Admin\*\*** — review, approve or reject requests, and monitor system activity

## **Expected Outcomes**

- Reduced manual tracking effort for librarians
- Faster turnaround time for book request approvals
- A centralized, searchable record of all book requests
- Data-driven insights into request volume and status through the dashboard
- A reusable foundation that could later be extended to a full library management system

## **Scope of the Project**

### **In Scope:**

- Custom table and form for book requests
- Auto-numbering and date validation logic
- Email notification automation
- Reporting and dashboard

### **Out of Scope (Future Enhancements):**

- Integration with actual library inventory/catalog
- Real-time book availability checking
- Mobile app version
- Fine/penalty tracking for late returns
